

IT OPERATIONS REVIEW

InfraRisk Analyzer

Review infrastructure changes before they become outages.

InfraRisk Analyzer is a Flask application for reviewing fictional proposed IT Changes. Operators can filter changes by Risk Level and Change Type, then review Risk Signals, mitigations, Rollback Plans, Approval Records, and Audit Trail events.

Demonstration data, not a production change-management or approval system. Low, Medium, and High are manually assigned Risk Levels explained by visible Risk Signals.

Implemented

- Shared responsive layout and original inline SVG logo
- JSON-backed IT Change model
- GET filters with validation and shareable URLs
- High-to-Low Risk Level ordering and result counts
- Clear-filter and no-results experiences
- Dense review metadata for proposed IT Changes

Verification

- Route-level pytest checks passing
- Home and Change Review Board rendered in headless Chrome
- Combined High Risk + Firewall filter confirmed
- Narrow responsive breakpoint confirmed
- No external API keys or network calls required

Figure 1. Landing page with project identity, purpose, server-rack warning mark, and primary action.

Filtered Change Review Board

The URL `/explore?risk_level=High&change_type=Firewall` combines both filters, preserves their selected values, reports one result, and displays the firewall allow rule change.

Figure 2. Desktop Change Review Board filtered to High Risk Firewall changes.

Narrow layout

At the narrow breakpoint, navigation remains available, introductory content wraps, and filter controls stack into touch-friendly full-width rows.

Figure 3. Change Review Board rendered at Chrome's verified narrow viewport.

Future work

Assignment 2 should add persistent IT Changes. Later work can add stored Risk Findings, Approval Records, Audit Trail events, search and retrieval, and AI-generated Risk Summaries.
